

# PLASTIC KILLER

## LIFE12 ENV/IT/000374

Co-funded by  
the European Community

### Testing Phase and Industrial Demonstration

During the last months, PAL, in collaboration with another company potentially interested in the purchase of the plant, produced many tons of MDF panels, combining the purified wood, output of the Plastic Killer, with some virgin wood. The surface quality of the panels was excellent, and their properties have been always compliant with the EN 622-5 standard.

The technical phase of the project is now at its end. The pilot plant has been temporarily transferred at the premises of the company which collaborated with PAL during the industrial demonstration phase, in order to produce a higher quantity of MDF panels and improve the performances of the plant, which will work at its full capacity.

PAL and CEPRA disseminated these results during some national and international fairs, such as Ecomondo (Rimini, Italy) from 08/11/2016 to 11/11/2016, and Eurobois (Lyon, France) from 15/11/2016 to 18/11/2016, and they are now working to organize the Final Conference of the project.
